

Cyber Security - Class 01

Date: September 7, 2024

- **Sniffing:**

Sniffing refers to monitoring and capturing data as it travels across a network. It allows viewing data but does not permit modification. Wireshark is commonly used for this purpose.

- **Linux Commands:**

- **To open Wireshark:**

Open the terminal, type Wireshark, and press enter. Select the eth0 interface to begin sniffing.

- **Applying a Display Filter:**

- `ip.address (or ip.addr) == 10.0.2.15`: Displays all packets where 10.0.2.15 is the source or destination.
 - `ip.src == 10.0.2.15`: Displays packets with 10.0.2.15 as the source.
 - `ip.dst == 10.0.2.15`: Displays packets with 10.0.2.15 as the destination.
 - *Note*: In this case, 10.0.2.15 is the Linux system's IP address.

- **To find the IP address in Linux:**

- Use the `ifconfig` command in the terminal.
 - The IP address appears next to `inet` (e.g., `inet 10.0.2.15`).

- **Windows Commands:**

- To display the IP address: Use `ipconfig /all`.
 - To view system details: Use the `systeminfo` command.

- **Run Command:**

- To view detailed system information in Windows, type `msinfo32` in the Run dialog.
