

Cyber Security - Class 04 (Theory 2)

Date: 19 September 2024

Lab Activity: Wireshark Usage

Steps:

1. Analyze TCP and IP Traffic:

- Use Wireshark to monitor traffic using the following filters:
 - tcp
 - ip.addr
 - ip.addr == 192.168.68.126 (to focus on a specific IP address).
 - ip.src == 192.168.68.126 (to filter traffic originating from this IP).

2. HTTP Statistics:

- Navigate to Wireshark → Statistics → HTTP to review HTTP-related data.

3. Testing a Web Application:

- Open the URL: testphp.vulnweb.com/login.php.
- Enter a sample username and password.

4. Capture HTTP Requests:

- In Wireshark, filter the traffic using the command: http.request.method == "POST".
- Look for HTTP traffic to /userinfo.php.

5. Extract Form Data:

- Locate the section labeled **HTML Form URL Encoded** to retrieve the submitted username and password.

This process demonstrates how to capture and analyze HTTP traffic using Wireshark, particularly focusing on POST requests to observe form data exchanges.
